This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF0010-ABF9989, ABH0010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                           Set of oligonucleotides, useful for diagnosis and cell typing, addesigned to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABF00010-ABF99989 and ABI00010-ABF82073

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF99899, ABF00010-ABF99899 and ABI00010-ABF8073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010 -ABC99989, ABF00010 -ABE9989, ABF00010 -ABE9989 and ABI00010 -ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

Mon Jul

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99999, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire printed specification, but fire wipo.int/pub/published_pct_sequences

0 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABR00010-ABH9989, and ABI00010-ABS0010 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at Gaps . 0 ch 3.9%; Score 11.4; DB 1; Length 13; 1 Similarity 92.3%; Pred. ```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABC0010.ABE9989, ABH00010.ABH99989 and ABI00010.ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WFPO at fite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
                                                                                                                                                                                                                                  This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated ganomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABH9989, and ABI00010-ABF9989, ABF00010-ABH9989 and ABI00010-ABIS2073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABE9989, ABH00010-ABH99989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire.wipo.int/pub/published_pct_sequences

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE09989, ABF0010-ABE9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99899, ABC0010-ABC99899 and ABI00010-ABC0010 ABC0010 ABC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE039989, ABE00010-ABE99989 and ABI00010-ABE3073 represent the oligomers described in the invention. NOTE: The sequence
                                                                                                                                         invention describes novel oligonucleotide primers or peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligonucleotide SEQ ID NO 99045 for detecting SNP TSC0024599.
                                                                Claim 1; SEQ ID NO 225398; 29pp + Sequence Listing; German.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010 ABC09989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABH82073 tepsesent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                         Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF0010-ABF9989, ABH0010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but

```

```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but
peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE99989, ABF00010-ABE99989, ABH00010-ABE99989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    central nervous system; gastrointestinal; respiratory; immune; metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory. Central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99999, ABF00010-ABH99999 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this parent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC09989, ABR0010-ABP9989 and ABI00010-ABR3073 represent the oligomers described in the invention. NOTE: The sequence data for this patent din ot form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99999, ABF00010-ABF99999, ABF00010-ABF99999, abmootle-ABE99999 and ABI00010-ABF90010 in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The bligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABI82073 tepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                            Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

```

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, coligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status. Claim 1; SEQ ID NO 168099; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and oytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The

ö ò acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomers lost status in chemically pretreated genomic DNA. The oligomerleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE039989, ABF00010-ABE9989, ABH0010-ABE9989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but twipo.int/pub/published_pct_sequences oligomers are also used for detecting cell type differentiation. ABC00010 -ABC9989, ABF0010-ABF99889, ABH0010-ABH9989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences This invention describes novel oligonucleotide primers or peptide nucleic central nervous system; gastrointestinal; respiratory; immune; metabolic. The present invention describes a novel enzymatic nucleic acid (ENA)
having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
(ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
ten 2'-O-methyl modifications; and fiv) a 3'-end modification. The ENA's
can inhibit collagenase and stromelysin production in the synovial
membrane of joints for the treatment or prevention of arthritis,
particularly osteoarthritis or rheumatoly of a donor to induce tolerance
to be used to treat antigen presenting cells of a donor to induce tolerance
in a recipient to an alloantigen of a donor. They can also be used for
chhancing graft tolerance or for treating autoimmune disease, and for
treating allergies and other inflammatory conditions. The ENA's can also
be used in diagnosis. Ribozyme therapy impacts on the expression of
stromelysin without introducing the non-specific effects upon gene
expression which accompany treatment with retinoids and dexamethasone.
The concentration of ribozyme required to affect a therapeutic treatment
is lower than that required of antisense molecules, and is highly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Enzymatic nucleic acid molecules having a hammer-head motif - used for
the treatment of arthritis, induction of graft tolerance or treatment of
auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

fragments (F) from the target nucleic acid; and (ii) analysing F by mass spectrometry (MS). The sequences in AAV3403 to AAV3952 are specifically claimed primers for use in the mass spectrometric analysis of the above process. The process is used to detect genetic diseases (e.g. haemophilia, thalassemia, Duchenne muscular dystrophy, Alzheimer's disease, cystic fibrosis and many others) or chromosomal abnormalities (or predisposition); infections and cancers; also for establishing identity and heredity. Particular applications are diagnosis of neuroblastoma, detecting telomerase, determining family relationships and HLA compatibility, and in genetic fingerprinting. Compared with known methods using MS, this process requires fewer specific reagents and is better suited to automation. Extended primers are shorter; primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequencing nucleic acid by mass spectrometric analysis - for detecting nucleic acids, telomerase activity, oncogene mutations, or cancerspecific sequences, for diagnosis of disease.

The present sequence appears in the specification, which describes a hybridisation probe used to differentiate between pathogenic and vaccine strains of cattle brucellosis. The method comprises digestion of DNA from the test strain with restriction enzyme Nco 1, transfer of the fragments obtained to filters, subsequent fixing of these onto the filters, hybridisation with a labelled sample, and examination of the results. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                    Differentiating pathogenic and vaccine strains of cattle brucellosis - using restriction digestion with Nco 1 and transfer of the DNA fragments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Probe used to identify pathogenic and vaccine strains of brucellosis.

differentiate between pathogenic and vaccine strains of cattle brucellosis. The method comprises digestion of DNA from the test strain with restriction enzyme Nco 1, transfer of the fragments obtained to filters, subsequent fixing of these onto the filters, hybridisation with a labelled sample, and examination of the results. Novel ribozymes for the treatment of diseases and conditions related to hepatitis C infection.

Claim 1; Page 69; 123pp; English.

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Heparitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to

```
The present invention describes a method developed for identifying a target nucleic acid sequence (NA) in a biological sample as normal or mutant, by hybridising the NA with a mutant or normal primer capable of hybridising to the mutated or wildfupe sequence in the target NA and identifying the target NA mass spectrometry. The method can be used of confidence of genetic disease, chromosomal abnormality, as predisposition to a genetic disease, cancer or an infection, by identifying a target nucleic acid sequence in a biological sample. The method is also useful for diagnosing a predisposition to a disease or condition (e.g. obesity, atherosclerosis) or to provide information condition (e.g. obesity, atherosclerosis) or to provide information called in the method is highly accurate, reliable and avoids electrophoretic.

The method is highly accurate, reliable and avoids electrophoretic.

The method is less expensive. Nucleic acid fragments are identified and detection steps. The entire method can be completed within 2 abeling and is less expensive. Nucleic acid fragments are identified and elected at the same tile by the specific molecular weights and the method allows rigorous controls for preventing false negative or positive results. The present sequence represents a DNA sequence used in an
                                                                                                                                                                                                                                                                                  .;
0
               length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
these sites and their activities optimised by either varying the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying target nucleic acid sequence in a biological sample useful for diagnosis of genetic disease or chromosomal abnormality, involves

The present invention provides the protein and coding sequences of several polymorphic variants of the human immunoglobulin E receptor beta formin (IGRRB). These contain single nucleotide polymorphisms (SNPs) which may be indicative of a predisposition to atopy, allergy, asthma, rhinitis and eczema. Also provided are the sequences of probes and primers for use in identifying the gencype of an individual with regards to the IGRBB gene. The IGRBB gene is found at human chromosome 11q13. The sequences are all useful in therapeutics. The present sequence was used to isolate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; immunoglobulin E receptor beta chain; IGERB; chromosome 11q13;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting a chromosome 1q21-q24 abnormality for diagnosing metabolic disease, such as human obesity and diabetic disorders, comprises examining insulin receptor-related receptor gene and its gene products.
  example from the present invention for solid state sequencing and mass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to insulin receptor-related receptor (TRRR) ("IRRR). Mutations in this gene indicate a chromosome 1q21-q234 abnormality. IRRR polypeptides and DNA may be useful in the diagnosis of disorders associated with abnormal expression of the IRRR protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Insulin receptor-related receptor; IRRR; chromosome 1q21-q24; obesity;

```
genetically distinct my carrier acceptabiline receptors, machine play important roles in higher brain function such as learning and memory. The protein is a possible drug target for treatments for Alzheimer's disease and dementia with Lewy bodies (DLB). The gene, polypeptide, haplotypes and antibodies raised against the protein are useful for diagnosing and expression of the gene or activity of the protein, e.g. Alzheimer's disease and dementia with Lewy bodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to identifying the presence or absence of a mutation in a target nucleic acid sequence. The method involves hybridizing the target sequence with an oligonucleotide probe complementary to a region of the target sequence that can contain a mutation. The resulting heteroduplex is treated with a single strand specific endonuclease and mass spectometry is used to detect the product. The method allows for rigorous controls to prevent false negative or subsequent detection of a label. The present sequence is a 15-mer template captured by a probe duplex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying mutation in nucleic acid sequence for diagnosing genetic disease, involves hybridizing target sequence with complementary probe and contacting the heteroduplex with single strand specific endonuclease.
    acetylcholine receptor, CHMR1. CHMR1 is one subtype of a family of 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3.9%; Score 11.4; DB 1; Length 15; 92.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                     엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of several polymorphic variants of the human immunoglobulin E receptor beta chain (IGERB). These contain single nucleotide polymorphisms (SNPs) which may be indicative of a predisposition to atopy, allergy, asthma, rhinitis and eczema. Also provided are the sequences of probes and primers for use in identifying the genotype of an individual with regards to the IGERB gene. The IGERB gene is found at human chromosome 11q13. The sequences are all useful in therapeutics. The present sequence was used to isolate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful to
                                                                                                                                                                                              Novel polynucleotide useful for therapeutic purposes, comprises nucleotide polymorphisms in immunoglobulin E receptor beta chain gene.

The present invention describes a method for detecting the presence of a target nucleic acid sequence in a biological sample comprises hybridising a detector oligonucleotide the target nucleic acid sequence, removing the hybridised detector oligonucleotide, and detecting the hybridised detector oligonucleotide, and detecting the hybridised diagnose (pre- or post-natally) a genetic disease or chromosomal abnormality, a predisposition to a disease or condition (e.g. obesity, atheredity a predisposition to a disease or condition (e.g. obesity, atheredity or compatibility, to detect a particular nucleic acid sequence in a biological sample. The method provides increased accuracy and reliability of nucleic acid detection by mass spectrometry, allow for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting a target nucleic acid sequence in a sample, useful for e.g. diagnosing a genetic or chromosomal abnormality, comprises detecting the detector oligonucleotide hybridized to the target nucleic acid by mass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        rigorous controls to prevent false negative or false positive results, avoid electrophoretic steps, and mass spectrometric analysis requires only about 2-3 hours. The method is faster and less expensive to perform
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   than existing DNA detection systems, and also much more accurate and reliable. The present sequence represents a nucleotide sequence which is used in an example from the present invention
                                                                                                                                                                                                                                                                               Chromosomal abnormality, detection, mass spectrometry, diagnosis; genetic disease; infection; obesity; atherosclerosis; cancer; pathogenic microorganism; DNA detection system; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3.9%; Score 11.4; DB 1; Length 15; 92.3%; Pred. demonstrate the method of the invention. The method involves use of mass spectrometry for identifying target nucleotide(s) present in nucleic acid molecule(s), detecting a target nucleotide present in a biological sample and determining whether a target nucleotide is present in nucleic acid molecule(s). The method is used for identifying target nucleotide(s) present in a biological sample and detecting a target nucleotide nucleotide present in nucleic acid molecule(s). The target nucleotides are identified and detected in nucleic acid molecule(s). The target nucleotides are identified and detected in nucleic acid molecule(s) browned fingerprint or is individual, and the target nucleotides a DNA fingerprint or is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               indicative of a genetic disease (such as obesity, atherosclerosis, cancer), chromosomal abnormality (either prenatally or postnatally), a genetic predisposition, a fungal, bacterial, or protist infection. The presence of the target nucleotide also indicates the presence of a mutation. They also provide information relating to identity, heredity, or compatibility (human leukocyte antigen (HLA) genotyping). The method is suiteble for the detection of single point mutations or microlesions of DNA and is also applicable in each disease gene or polymorphic region in the genome e.g. variable number of tandem repeats (VNTR) or other single nucleotide polymorphisms (e.g. apolipoprotein gene). The processes described above provide for increased accuracy and reliability of nucleic acid detection by mass spectrometry, in addition the processes allow for regress controls to prevent false positive or false negative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

AAF46555

IGFBP2 oligonucleotide #1394.

(first entry)

30-MAR-2001

AAF46555;

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBB], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, hepplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition such as a neovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic; dermatological; cardiant; virucide; ophtialmological; keloid; shi discorder; Insulin-like Growth Factor 1 receptor; IGF-1; pityriasis; IGF binding procein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhees; ruba; keratosis; neophasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition; hyperplasia; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 15 BP; 0 A; 5 C; 3 G; 7 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAP45151 and AAP45153. FA5161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for ameliorating the effects of

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [16F]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAP45153-154514). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serbornhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

The invention relates to a method of detecting target nucleic acid sequences (S) in a biological sample, comprising performing on nucleic acid molecule(s) containing (S), a first polymerase chain reaction (PCR) to produce a first amplification product (P1), performing on P1 a second pCR to produce a second amplification product (P2), and detecting P2 by mass spectrometry, thus detecting the presence of (S) in the biological sample. The method is useful for detecting the presence of target nucleic cample. The method is useful for detecting the presence of target nucleic sample. The method is sample obtained from an individual, and detecting (S) provides a DNA fingerprint or is indicative of a disease or conditions useful infection, and protist infection. The method is useful to diagnose (e.g., prenatally or postnatally) a genetic disease or chromosomal abnormality, a corpostnatally or disease or chromosomal abnormality, a cancer), or infection by a pathogenic organism (e.g., virus, bacteria, parasitic or fungus), or to provide information relating to identity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   heredity, or compatibility (e.g. human leukocyte antigen (HLA)
phenotyping). The method is fast, highly accurate and reliable. ABK98702-

                                                                                                                                                                                                                                                                                The invention relates to mass spectrometric processes useful for detecting nucleic acids in a biological sample, comprises amplifying nucleic acid molecules and analysing using matrix-assisted laser describion/ionisation (MALDI) time-of-flight (TOF) mass spectrometry. The methods are used to diagnose (e.g., prenatally or postnatally) a genetic disease or chromosomal abnormality; a predisposition to a disease or condition (e.g., obesity, atherosclerosis, cancer), or infection by a pathogenic organism (e.g., virus, bacteria, parasite or fungus); or to provide information relating to identity, heredity, or compatibility (e.g., HIA phenotyping). The present sequence is an oligonucleotide used in solid state sequencing and mass spectrometer detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosis; genetic disease; chromosomal abnormality; infection; heredity; mass spectrometry; ss.
                                                                                                                                                                                                                      Detecting target nucleic acid sequences in a biological sample comprises amplifying NA molecules and analyzing using matrix-assisted laser desorption/ionization time of flight mass spectrometry.

Detecting a target nucleic acid sequence, useful for diagnosing a genetic disease, a chromosomal abnormality or an infection by a pathogen, or for determining identity or heredity, by employing mass spectrometry-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence, useful for diagnosing a genetic disease, a chromosomal abnormality or an infection by a pethogen and for determining identity or heredity by employing mass spectrometry-based processes. The method involves hybridising a primer to a nucleic acid molecule comprising a primer acid sequence, extending the primer using a polymerase to produce an extension product, selectively cleaving the 5' end of the primer from the extension product to produce a portion of the primer and a cleaved extension product and detecting the cleaved extension product by mass spectrometry. The present sequence is an oligonucleotide related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Solute carrier family 6 neurotransmiter transporter; sectonin 4; SLC6A4; genotyping; allele specific oligonuclectide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 gene for identifying drugs for treating disorders related to expression

ö

The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, sectornin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4 gene 22222222222

Novel polymorphic variants of zinc finger protein homologous to zfp-36 in mouse gene, useful in studying expression and function of the protein, useful for screening drugs to treat diseases e.g. rheumatoid arthritis.

Claim 16; Page 13; 60pp; English

The present sequence is that of an oligonucleotide used for assaying a polymorphism in the zinc finger protein homologous to zfp-36 in mouse (ZFP56) gene of the invention. The specification describes a newly isolated polynucleotide comprising a sequence which is a polymorphic variant (PV) of a reference sequence for the ZFP36 gene (see ABA97001) or its fragment and its encoded protein. The ZFP36 polynucleotides and polypeptides have antirheumantic, immunosuppressive and antiarthritic activities. The ZFP36 polypeptide is useful for screening drugs targeting the ZFP36 polypeptide or haplotype pairs are useful for improving the efficiency and reliability of the discovery and development of fungs for treating diseases associated with ZFP36 activity, e.g., autoimmune diseases such as rheumatoid arthritis. Haplotyping the ZFP36 gene in an individual gives useful information for validating ZFP36 as a candidate target for treating a specific condition predicted to be

```
individual can give information used for developing diagnostic tests and therapeutic treatments. The isolated polymucleotide is useful in studying the expression and function of ZFP56 and in drug screening. Antibodies specific for the ZFP56 protein are useful in many diagnostic and prognostic formats and therapeutic methods. A recombinant non-human organism transformed with the ZFP36 gene is useful in studying expression of the ZFP36 isogenes in vivo, for in vivo drug screening and testing. Allele-specific oligonucleotides (ASO) are useful as probes and primers
associated with ZFP36 activity. Genotyping the ZFP36
                                                                                                                                                                                                                                                                              and for assaying a polymorphism in the target region

Genotyping human small inducible cytokine A1-I-309, homologous to mou: Tca-3 gene of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of the gene individual, involves determining identity

Claim 15; Page 13; 58pp; English.

The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human small inducible cytokine Al-I-309 (SCYA1) gene located on chromosome 17, and methods for haplotyping and/or genotyping the SCYA3 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers and/or primer-extension oligonucleotides for detecting the SCYA1 gene polymorphisms. The polymucleotides and screened compounds are useful for the treatment of diseases associated with SCYA1 activity, such as atherosclerosis, human immunodeficiency virus (HIV) infection, and other inflammatory disorders.

AASI4438 AASI4455 represent ASO primers for detecting human SCYA1 gene oolymorphisms

The invention comprises DNA, cDNA and protein sequences of the human electron-transfer flavoprotein, beta polypeptide (ETFB) gene (located on chromosome 19q13.3-13.4). The invention specifically relates to the identification of 27 novel polymorphic sites within the ETFB gene.

Electron-transfer flavoprotein (ETF) is an obligatory electron acceptor for nine primary flavoprotein (ETF) is an obligatory electron acceptor mitochondrial matrix. ETF is composed of an alpha (ETFA) and a beta (ETFB) subunit. Electrons accepted by ETF are transferred to the mitochondrial respiratory chain by ETF dehydrogenases (ETFPHs).

CC peficiency of ETF or ETFDH leads to glutaric acidaemia type IT (GAII). Therefore ETFB is a pharmaceutically important gene in the treatment of GAII. The novel ETFB polymorphisms identified in the invention are useful for genotyping and haplotyping the ETFB gene of an individual. The ETFB protein and nucleic acids of the invention are useful for sepression and function of ETFB in vivo. The ETFB protein and mucleic acids are also useful for testing the efficacy of therapeutic and and class are also useful for testing the efficacy of therapeutic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated human electron-transfer-flavoprotein, beta polynucleotide, useful for therapeutic purposes, for studying the expression and function of the polynucleotide, and for expressing the flavoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; electron-transfer flavoprotein beta polypeptide; ETFB; electron acceptor; mitochondrial matrix; glutaric acidaemia type II; novel polymorphic site; novel polymorphism; ETFB genotype; 85; GAII; ETFB haplotype; transgenic animal; primer; probe; chromosome 19q13; primer-extension oligonucleotide; single nucleotide polymorphism; SNP.

compounds for glutaric acidaemia type II. The nucleic acids of the invention are useful in the production of a transgenic animal expressing the ETFB gene. Nucleic acids ABL39414-ABL39440 represent claimed ETFB

```
The invention relates to single nucleotide polymorphisms in the gene encoding the human caspase 5, apoptosis-related cysteine protease (CASP5) to Dypeptide. A method for haplotyping the CASP5 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the CASP5 haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype or haplotype or haplotype pair in a population exhibiting the trait with the haplotype or haplotype pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair in a reference computation, where a higher haplotype frequency in the trait population indicates the trait is associated with the haplotype or haplotype pair. CASP5 and its corresponding DNA are used for studying the expression and function of CASP5, for use in screening for candidate drugs to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0

The invention relates to detecting a target nucleic acid sequence present in a biological sample or in a nucleic acid molecule, comprising detecting a hybridised oligonucleotide or a cleavage product by mass spectrometry (e.g. matrix assisted laser desorption/ionisation time-of-flight (MALDI-TOF), Electrospray (ES), ion cyclotron resonance (ICR) and fourier transform) as a indication of the presence of the target nucleic acid. The method is useful for detecting nucleic acid molecules and sequences in the molecules. The method is particularly useful for disease (e.g. oystic fibrosis, hasemophilias, thalassaemias, Duchenne muscular dystrophy, Huntingdon's disease and Alzheimer's disease), or a chromosomal abnormality (e.g. in Down's Syndrome, Patau syndrome, Patau syndrome, sparation so a chromosomal abnormality (e.g. in Down's Klinefelter's syndrome, a predisposition to a disease/condition (autoimmune diseases, diabetes, cancer, obesity and arteriosclerosis) or infection by a pathogen (e.g. human immunodeficiency virus, HIV, infection or hepatitis B virus infection), or for determining identity or heredity. The present sequence is a solid state sequencing template used controcons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of mass spectrometry for detecting hybridized oligonucleotide or a cleavage product of a target nucleic acid sequence, especially useful for diagnosing a genetic disease, chromosomal abnormality or infection by a

The present invention relates to a new novel polynucleotide with a sequence having a solute carrier family 26, member 2 (SLC26A2) isogene sequence having a solute carrier family 26, member 2 (SLC26A2) isogene selected from 4 isogenes, with regions of a sequence of 12212 bp as given in specification. The new polynucleotide is also defined by a corresponding set of polymorphisms whose locations and identities are useful for improving the efficiency and reliability of several steps in the slocked provery and development of drugs for treating diseases associated with SLC26A2 activity e.g. osteochondrodysplasias. The methods of the invention are useful for haplotyping and genetyping the SLC26A2 gene in individual. Allele-specific oligonucleotides (ASO) are useful as probes and primers, and for assaying a polymorphism in the target region. Without requiring any a prior knowledge of the phenotypic effect of any particular SLC26A2 polymorphism, the methods of the invention provide the continity with a tool to identify lead compounds that are more likely to show efficacy in clinical trials. The present nucleic acid sequence checked and provided provided the show efficacy in clinical trials. The present nucleic acid sequence corresponds that are more likely to show efficacy in clinical trials. The present nucleic acid sequence.

The present invention relates to genetic variants of human neurotrophin (NTF) 3 gene. The invention also relates to compositions and methods for haplotyping and/or genotyping the NTF3 gene in an individual. Sequences of the invention are useful for studying the expression and function of NTF3 protein for use in screening for candidate drugs to treat diseases related to NTF3 activity. The polymorphism and haplotype data is useful for validating whether NTF3 is a suitable target for drugs to treat nervous system disorders and congenital heart defects, screening for such drugs and reducing bias in clinical trials of such drugs. They are also useful for therapeutic purposes. The haplotyping method is useful for improving the efficiency and outcome of several steps in the discovery and development of drugs for treating diseases associated with NTF3 activity such as nervous system diseases and congenital heart defects. It is also useful for validating NTF3 as a candidate target for treating a specific condition or disease predicted to be associated with NTF3 activity. The method is also useful for screening compounds to treat a specific condition or disease predicted to be associated with NTF3 and activity. The method is also useful for screening compounds to treat a specific condition or disease predicted to be associated with NTF3 and activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polymorphic variants of neurotrophin 3 (NTF3), useful for studying the expression and function of NTF3, and for screening candidate drugs to treat nervous system disorders and congenital heart defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     activity. Sequences of the invention are also used in gene therapy. The present DNA sequence is an allele-specific oligonucleotide (ASO) probe used to detect human NTF3 gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, genetic variant, neurotrophin 3; NTF3; haplotyping; genotyping; nervous system disorder, congenital heart defect, gene therapy; therapeutic; polymorphism; allele-specific oligonucleotide; ASO probe;
                                                                                                                                                                                                                                                                                                                                                                  Human neurotrophin 3 (NTF3) gene polymorphism detecting ASO probe #5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3.9%; Score 11.4; DB 1; Length 15; 00.0%; Pred. The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent was printed specification. The complete sequence data for this patent was betained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                           Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication; cirrhosis, virucide; liver failure, hepatocellular carcinoma, HCV infection, drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                          Hepatitis C virus substrate #571 for HCV hammerhead ribozyme #571.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .;

Human lysosomal acid phosphatase 2 (ACP2) allele-specific PCR primer 31. Tanguay DA; (GENA-) GENAISSANCE PHARM INC 07-JUN-2001; 2001WO-US018457. 07-JUN-2000; 2000US-0210047P.

Novel genetic variants of acid phosphatase 2, lysosomal polypeptide useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. Hodgkin's disease.

Claim 17; Page 14; 109pp; English

The invention comprises the human lysosomal acid phosphatase 2 (ACP2)

uucleic acid and protein sequences. Specifically, the invention relates

to the discovery of 22 novel polymorphic sites within the APC2 gene. The

invention also comprises methods for haplotyping and genotyping the ACP2

gene in an individual. The ACP2 gene (located on chromosome 11) encodes a

tysosomal-specific enzyme that catalyses the hydrolysis of

cytosomal-specific arryme that catalyses the hydrolysis of

cytosomal-specific progratuate deficiency. The novel ACP2 gene and

cytosomal and acid phosphatase deficiency. The novel ACP2 gene

cytosomal and acid phosphatase deficiency. The novel ACP2 gene

cytosomal specific novertion are useful in haplotyping the ACP2 gene

cytosomal specific cheatened disease or condition (e.g. Hodgkin's

cytosomal acid phosphatase deficiency). The ACP2 gene polymorphisms are

cytosomal acid phosphatase deficiency). The ACP2 gene polymorphisms are

cytosomal acid phosphatase deficiency). The ACP2 gene polymorphisms are

cytosomal acid phosphatase deficiency). The ACP2 gene polymorphisms are

cytosomal acid phosphatese deficiency of a transgenic acids of

chests and therapeutic treatments. The ACP2 gene polymorphisms are

cytosomal in the production of a transgenic animal which

expresses ACP2 protein. The ACP2 nucleic acids of the invention are

useful in the production of a Lallele-specific oligonucleocides designed to

cytosomal production of allele-specific probes. Nucleic acids ABL36321

AAS95905 standard; DNA; 15 BP RESULT 987 AAS95905/c ID AAS95 XX

The invention relates to an isolated polymucleotide comprising a sequence selected from a polymorphic variant of calmodulin 1 (CALM1). The polymorphic variant comprises an CALM1 isogene defined by a haplotype selected from haplotypes 1-21 given in the specification. The polymorphisms are useful for studying the biological function of CALM1 as well as in identifying drugs targeting this protein for the treatment of a disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting CALM1 to treat a specific condition or disease predicted to be associated with CALM1 activity. Establishing CALM1 haplotype or haplotype pair of an individual is useful for improving the efficiency and certaing diseases associated with SCYR3 activity, e.g. Alzheimer's disease and diseases involving defects in calcium-dependent signal continual design of clinical trials of candidate drugs for treating as leading to the calcium of the cal New calmodulin-1 (CALM-1) isogene polymorphic variants, useful in expressing CALM1 protein for use in screening for candidate drugs to treat diseases related to CALM1 activity such as Alzheimer's disease. specific condition or disease predicted to be associated with CALMI activity. AAS9204AAS96018 represent human CALMI allele- specific oligonucleotides and pro maintain a feet of the same and properties.                                                                                                                                                                                                                                              The invention comprises oligonucleotides for detecting and identifying subtypes of human papilloma virus (HPV) contained in a sample. The oligonucleotides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an HPV detection oligonucleotide of the invention.
                                                                                                                                                                              Detector for identifying human papilloma virus subtypes, comprises carrier having two parts carrying first and second oligonucleotides that respectively hybridize with DNA contained in first and second subtypes of

Primers AAQ95497-8 were used to generate a fragment containing a multicloning site in the novel plasmid pSE. This plasmid is derived from pSC (a pucl8 based plasmid) which contains an antibody light chain (C-kappa) and heavy chain (C-gamea). Constant region coding sequence, each under control of the SR-alpha promoter and linked to an appropriate signal peptide sequence. The light and heavy chain sequences have restriction sites created at the 5' ends of the coding sequences for the insertion of an antibody variable-region library created using the primers AAQ95503-39. The primers AAQ9549-8 were used to create an extra ECC primers AAQ55503-39. The primers AAQ9549-8 were used to create an extra ECC primers AAQ95503-39. The library is inserted in frame with constant region coding sequence. The library is inserted in frame with carry chain constant region is also linked to a transmembrane domain. Thus expression produces from the vector will form an antibody which are membrane-bound. The vectors are used for the preparation of an antibody variable base sequence of an antipodic for the preparation of an antibody using these antibodies allow production of a human monoclonal antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
Novel expression screening vector - used for preparing an antibody variable region library comprising eukaryotic cells expressing membrane-bound polypeptide at the cell surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= c

Sequences shown in AAV18100 to AAV18129 represent the nucleotide sequences of the intron-exon junctions of the human hydronephrosis (HNG) gene. A translocation partner to this HNG gene on chromosome 6 is the chromosome 19 USF2 gene. The HNG gene can be used as a starting point to design sultable compounds or techniques for the treatment of renal diseases or disorders, or nucleotide probes for diagnosing cells involved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hydronephrosis gene - useful to treat or diagnose renal diseases and disorders, e.g. vesical-ureteral reflux, pelvi-ureteral junction obstruction, multicystic renal dysplasia or renal agenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 3; Fig 10; 73pp; English.

Specifically, the 17mers are able to form a triplex with SV40 DNA. In the first version of the oligomer (II) there is a phosphorothicate linkage between nucleotides 2 and 3 and in the second version (III) there are two phosphorothicate linkages, one between nucleotides 16 and 17

                                                                                                                                                                           This sequence represents an antisense oligonucleotide of the invention. The antisense oligonucleotide analogs (ONS) have a sequence complementary to a sequence of nucleotides 415-445 of human papilloma virus-16 (HPV-16). The antisense ONS can be used to inhibit expression of HPV gene E6/E7 in living cells, preferably human keratinocytes or human cervical cells. They bind to E6/E7 mRNA in the cell, prevent mRNA translation and promote mRNA degradation by intracellular RNASS H. They can be used for preventing transformation of living cells by HPV. The antisense ONs are
New antisense oligonucleotide analogs for inhibiting growth of cervical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                 This sequence represents an antisense oligonucleotide of the invention. The antisense oligonucleotide analogs (ONS) have a sequence complementary to a sequence of nucleotides 415-445 of human papilloma virus-16 (HPV-16). The antisense ONS can be used to inhibit expression of HPV gene E6/E7 in living cells, preferably human keratinocytes or human cervical cells. They bind to E6/E7 mRNA in the cell, prevent mRNA translation and promote mRNA degradation by intracellular RNASE H. They can be used for preventing transformation of living cells by HPV. The antisense ONS are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Triplex formation; DNA detection; triple helix; identification; bacteria;

The present sequence represents a polynucleotide that is able to form a triple helix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methylcytosine for increased triplex stability. The present sequence is used in the assay of the invention, where it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded DNA test sequences to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA, where either a part structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. Triplex formation results in sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detecting of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      intracellular adhesion molecule, dermatological, antiasthmatic, antiinflammatory, immunosuppressive, gastrointestinal, psoriasis, neurodermatitis, allergic asthma, Crohn's disease, autoimmune disease, transplant rejection, psoralen, photo-ultra-violet therapy, ds.

(they bind directly to the gene, so a compensatory increase in transcription is not possible). (A) may be coupled to psoralen to provide light-regulatable, sequence-specific downregulation of genes; this should make photo-ultra-violet therapy more specific, with reduced side effects.
                                                                                                                                                                                                                                                                                                                        triple-helix forming oligonucleotides, having at least 3 sequential purine and/or pyrimidine bases, capable of inhibiting transcription of ICAM-1. (A) has a sequence specific for the transcribed or promoter regions of the ICAM-1 (intracellular adhesion molecule) gene. The products of the invention have antipsoriatic, dermatological, antiasthmatic, antiinflammatory, immunosuppressive and gastrointestinal activity. (A) are used for treatment or prevention of ICAM-1-associated diseases, specifically psoriasis, neurodermatitis, allergic asthma, crohn's disease, autoimmune diseases and transplant rejection. Compared with antisense oligonucleotides, (A) provide a longer-lasting effect
                                                                                                                                                                                                                                                                                                            This invention describes novel polydeoxyribonucleotides (A), for use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ICAM-1; triple helix; transcription inhibition; antipsoriatic; intracellular adhesion molecule; dermatological; antiasthmatic; antihlfammatory; immunosuppressive; gastrointestinal; psoriasis; neurodermatitis; allergic asthma; Crohn's disease; autoimmune disease; transplant rejection; psoralen; photo-ultra-violet therapy; ds.
                                                                                                                                                                                       Triple-helix forming polydeoxyribonucleotides, useful for treating intracellular adhesion molecule-1 related diseases, e.g. psoriasis, directed against transcribed or promoter regions of the ICAM-1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAI68599-AAI68673 represent oligonucleotides used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ICAM-1 triple helix associated oligonucleotide SEQ ID 51.

products of the invention have antipocriatic, dermatological, antiasthmatic, antinflammatory, immunosuppressive and gastrointestinal activity. (A) are used for treatment or prevention of ICAM-1-associated diseases, specifically psoriasis, neurodermatitis, allergic asthma, crohn's disease, autoimmune diseases and transplant rejection. Compared with antisense oligonucleotides, (A) provide a longer-lasting effect (they bind directly to the gene, so a compensatory increase in transcription is not possible). (A) may be coupled to psoralen to provide tight-regulatable, sequence-specific downregulation of genes; this should make photo-ultra-violet therapy more specific, with reduced side effects. AA168599-AA168673 represent oligonucleotides used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                  This invention describes novel polydeoxyribonucleotides (A), for use as
                                                                                                                                                                                                              triple-helix forming oligonuclectides, having at least 3 sequential purine and/or pyrimidine bases, capable of inhibiting transcription of ICAM-1. (A) has a sequence specific for the transcribed or promoter regions of the ICAM-1 (intracellular adhesion molecule) gene. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                     Triple-helix forming polydeoxyribonucleotides, useful for treating intracellular adhesion molecule-1 related diseases, e.g. psoriasis, directed against transcribed or promoter regions of the ICAM-1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding human prostate membrane-specific antigen,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0

rangularies of at least 10 cursecuries of these microcuries, a caquence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as expensions. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or call degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and be propertied are nucleotides and polypeptides can be used for diagnosis of the expression of the nucleotides and polypeptides can be used for diagnosis and polypeptides can be used for diagnosis. The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; veruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss. useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies. also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal . 0 Mcswiggen JA; Score 11.4; DB 1; Length 17; Pred. The sequences given in AAQ47613-20 show regions of homology between jun sequences and the human jun-D specific probe HVMD965 which may be of use as jun-D specific probes. They were used in the method of the invention for the detection and quantification of mRNAs in a sample without the need to purify the mRNA from cells. The claimed method comprises identifying an ollygomer complementary to this sequence to an insoluble support. The sample is then incubated with the insoluble support and that the unique sequence will hybridise to the bound oligomer and be immobilised. Non-immobilised components are washed from the support and bound RNA is labelled in such a way that the label is incorporated onto the support relative to the amount of much and can be used for the reliable, signification of multiple varieties of mRNA. It may be used for diagnosing and recognition of pathophysiciology of various disease states, eg, hereditary diseases, cancer, and infectious diseases. A genetic deficiency of Gs protein is the molecular basis of hereditary osteodystrophy. Pituitary tumours in acromegalic parients have been shown to contain mutant Gs proteins. G proteins are also involved in invasive and metastatic melanoma cells, and diabetes. See also AAQ47381-666. (Updated on 25-WAR-2003 to correct PN field.) Quantitating messenger RNA in sample - using immobilised-polynucleotide having sequence complementary to sequence unique to the MRNA. Example 9; Page 73; 177pp; English.

Quantitating messenger RNA in sample - using immobilised-polynucleotide having sequence complementary to sequence unique to the MRNA.

Example 9; Page 73; 177pp; English

The sequences given in AAQ47613-20 show regions of homology between jun sequences and the human jun-D specific probe HUMD965 which may be of use as jun-D specific probes. They were used in the method of the invention for the detection and quantification of mRNAs in a sample without the need to purify the mRNA from cells. The claimed method comprises identifying a polymuoleotide sequence unique to the mRNA, and immobilishing an oligomer complementary to this sequence to an insoluble support. The sample is then incubated with the insoluble support such that the unique sequence will hybridise to the bound oligomer and be immobilised. Non-immobilised components are washed from the support and bound RNA is labelled in such a way that the label is incorporated onto the support relative to the amount of mRNA on the support. The amount of bound label is then determined. This method can be used for the reliable, rapid, simultaneous quantification of multiple varieties of mRNA. It may be used for diagnosting and recognition of pathophysiciolay of various may be used for diagnosting and recognition of pathophysicions. disease states, eg. hereditary diseases, cancer, and infectious diseases. Of proteins are thought to be involved in causing various disease states. A genetic deficiency of Gs protein is the molecular basis of hereditary osteodystrophy. Pituitary tumours in acromegalic patients have been shown to contain mutant Gs proteins. G proteins are also involved in invasive and metastatic melanoma cells, and diabetes. See also AAQ47381-666.                                                                                                                                                                                                                                                                                                      à
                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                   This oligonucleotide is one of a series of antisense oligonucleotides targeted to codon 717 of the mutant beta-APP gene in which a G to A mutation results in a Val (GTC) to 11e (ATC) mutation. The antisense oligonucleotide can be used to detect mutant beta-APP and to modulate beta-APP expression and so treat conditions arising from overproduction of beta-amyloid. In the antisense oligonucleotides of the invention, at least some of the phosphodiester bonds are pref. substituted with sulphur containing (esp. phosphoro- thioate) bonds and at least one of the bases is pref. modified at the 2' position, e.g. 2'-O-methylated.                                                                                                                                The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour ragiogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAXX0.275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fins-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                          stability – useful for treating e.g. tumour angiogenesis, psoriasis,
rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

```
The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fit-1), kinase insert domain containing angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                   Vascular endothelial growth factor receptor; VEGF receptor; [It-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; KDR, tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                           which specifically cleave RNA derived from an epidermal growth factor receptor (BGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090 represent specifically claimed target sequence from human BGF-R. AAV98044 to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human BGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                      Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for
                                                                                                                                                                                                                                                                                                                                                     The present invention describes enzymatic nucleic acid molecules (NAMS)

The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-N) gene. AAV9721 to AAV98043 and AAV98999 to AAV98090 to represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human BGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                                                                           Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for treating cancers.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon muclear transporter (ARNY) gene, an integrin alpha 6 subunit gene, or a The-2 gene. AAA17675 to AAA1767 and AAA17661 to AAA17623 to AAA1888 represent their corresponding target sequences; AAA1968 to AAA19184 represent their corresponding target sequences; and AAA19155 to AAA19152 represent their corresponding target sequences; cc AAA19153 to AAA19152 represent their corresponding target sequences; and AAA19156 to AAA19150 and AAA19150 to AAA19150 and AAA19150 to AAA19150 and AAA21601 to AAA2159 represent ribozyme sequences; cc AAA1953 to AAA2169 to AAA21601 and AAA21501 to AAA2150 represent ribozyme sequences; cc AAA2169 to AAA21601 and AAA21501 to AAA21342 represent their corresponding target sequences; cc AAA2169 to AAA2169 encoding target sequences; cf integrin subunit beta 3, and AAA2342 represent ribozyme sequence for integrin subunit beta 3, integrin subunit alpha 6, or Tie-2. They are stability of an mRNA encoding angiogenic factor, especially was to treat cancer, diabetic retinopathy, age related concern subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related concern diabetic retinopathy, age related concern diabetic retinopathy, age related angiolismome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes end diseases related to the levels of ARNI, Tie-2, integrin conversion 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0;
                                                                                                                                                                          ribozymes for modulating the synthesis, expression and/or stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

capable of modulating a process in a biological system. In method comprises:

capable of modulating a process in a biological system. The method comprises:

comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endounclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific acid, particularly for treating systemic diseases.

Cleave target nucleic acid, particularly for treating systemic diseases caused by specific acid, and to determine or -raf RNA. Specifically NACs ascites and infection. They may also be used to detect genetic drift and mutations in diseased calls and to determine or -raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, posniasis or rheumatoid arthritis, or used to treat concer, restenosis, posniasis or rheumatoid arthritis, or of sugar/phosphate modifications increases steability against nuclease and activity. AAV99922 to AAV99317 represent NACs that can be used in the modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, c-raf, A-raf; B-raf; hammerhead ribozyme; hairpin ribozyme; target; substrate; catalyst; modulation; expression; Raf gene; delivery; screening; identification; synthesis; deprotection; purification; cancer; inflammation; psoriasis; non-hepatic ascites; infection; genetic drift; restenosis; rheumatoid arthritis; ss.
method has been developed for the identification of a nucleic acid

Action of a nucleic acid capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method capable of modulating a the process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with cendomuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and ascites and infection. They may also be used to detect genetic drift and custom in the RNA-cleaving activity that modulate expression of the RAF gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of craft. Introduction of sugar/phosphate modifications in discreases stability against nuclease and activity. ARV90222 to AAV93877 represent NACs that can be used in the modulating the expression of a RAF gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, c-raf, A-raf, B-iaf, hammerhead ribozyme, hairpin ribozyme;

Amethod has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic comprising a caid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with cendonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to are used by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepstic ascites and infection. They may also be used to detect genetic drift and ascites and infection. They may also be used to detect genetic drift and with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications in discreases stability against nuclease and activity. Anvy0922 to AAV93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene
screening; identification; synthesis; deprotection; purification; cancer; inflammation; psoriasis; non-hepatic ascites; infection; genetic drift; restenosis; rheumatoid arthritis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Burgin A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bellon

encoding an abnormally expressed beta-APP, and where at least one of the linkages between the nucleotides is a phosphorothicate linkage, a 2'-0-alkyl moiety, or a 2'-0-methyl moiety. The oligonucleotides are used as nucleic acid hybridisation probes for diaposis of diseases associated with abnormal beta-APP expression, e.g. Alzheimer's disease, or as antisense molecules for inhibiting abnormal beta-APP expression, e.g. for AAV63348-51 represent phosphorothioate antisense oligonucleotides directed against the beta-amyloid precursor protein (APP) mRNA codon 717, when it contains a G to A mutation. The specification describes oligonucleotides which specifically hybridise to beta-APP gene sequences Oligo:nucleotide(s) specific for abnormal beta-amyloid precursor protein gene - useful for detection or anti:sense inhibition of the protein, and thus diagnosis and treatment of Alzheimer's disease. Antisense oligonucleotide directed against beta-APP mutated codon 717 Phosphorothioate, antisense oligonucleotide, beta-amyloid precursor protein, beta-APP, Alzheimer's disease, Nucleic acid transporter system ligand containing template #2. 3.9%; Score 11.4; DB 1; Length 17; 92.3%; Pred. The method capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (D) identifying NAC a random sequence, and a catalytic domain (CD); and (D) identifying NAC at least part of the SBDs in such systems. Nucleic acid molecules with choosing a part of the SBDs in such systems. Nucleic acid molecules with care used to modulate gene expression in plant and mammanian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic mattions and infection. They may also be used to detect genetic difft and mutations in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. ANA99221 to ANA93A77 represent NACS that can be used in the ö Human; c-raf; A-raf; B-raf; hammerhead ribozyme; hairpin ribozyme;

The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver transporter system is used in gene therapy, particularly to deliver transporter systems are also used to create transgenic animals (as models for human carting cardis or disease, cancer, and infection. The transporter systems are also used to create transgenic animals (as models for human carting calls to produce proteins, or transfecting calls in vitro to study the function of the nucleic acid. The use of a surface ligand calls was specific targeting of selected calls and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from consumers, without requiring endosomal or lysosomal degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

The invention relates to a nucleic acid transport system (NTS) for delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognizes and binds to a cell surface receptor or antigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is capable of moving or initiating movement through a nuclear membrane; and/or (e) a lysis moiety that enables the transport of the entire complex from the cell surface directly into the cytoplasm of the cell. The NTS correctly into the cytoplasm of the cell. The NTS correctly into the cytoplasm of the cell. The NTS correctly into the cytoplasm of the cell. The NTS capables the transport of the entire complex of specific cells. The NTS can be used to transport of transgenic animals for assessing human disease, such as cancer, in an animal model. The NTS can be used in vitro with tissue culture cells. The NTS can be used in vitro with tissue culture cells. The NTS can be used in vitro with tissue culture cells. The NTS can agent within the NTS avoids the problem of endosomal/lysosomal
                                                                                                                                                                                                                                                                                                                                                             Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model.

                                                                                                                                                                                                                                                                                                                                                              d
                                                                                                                                                                                                                         The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate with a target sequence and contain at least one phosphoro(di)thioate with a target sequence activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor.

C nucleic acid (A') that modulates expression of the coestrogen receptor.

C on the conditions associated with levels of oestrogen receptor.

C for other conditions associated with levels of oestrogen receptor.

C secuse of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of therapeutic targets, and as research resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences.

CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences.

CC AAA2593 to AAA25020 represent their corresponding target sequences.

CS AAA25019 to AAA26219 represent their corresponding target sequences and sequences. and seasons used in the exemplification of the present invention.

Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid delivery, nucleic acid transporter system; hormone; enzyme; growth factor; clotting factor; apolipoprotein; receptor; drug; oncogene; tumor antigen; tumor suppressor; viral antigen; parasitic antigen;
                                                                                                                                                                                                   Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                            This invention describes a novel system (I) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding molecule noncovalently bound to a nucleic acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to ancelorar ligand. The complexes are similtaneously bound to the nucleic acid. The nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, applipoprotechins, receptors, drugs, oncogenes, tumor antigens, tumor suppressors, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of

```
The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; antiparkinsonian; mescular; CD20; neuroprotective; antiparkinsonian; custing archine; notropic; neuroprotective; antiparkinsonian; bnAzyme; inozyme; inozyme; dever; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; Munan immundeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cenebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemocherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; parkinson's disease; adisease; multiple sclerosis; parkinson's disease; multiple sclerosis; parkinson's disease;
